

HMPD QUANTUM ARCHITECTURAL AUDIT

TXN ID: HMPD-RUN-2439 | SESSION: UESP-AGENT-0

To determine the required modular building ablutions, we'll follow the guidelines for sanitary facilities in temporary or modular buildings.

For males:

- 1 toilet per 10 males (minimum)
- 1 urinal per 20 males (minimum)
- 1 washbasin per 10 males (minimum)

For females:

- 1 toilet per 10 females (minimum)
- 1 washbasin per 10 females (minimum)

Based on these guidelines, for 25 males:

- Toilets: $25 / 10 = 2.5$, round up to 3 toilets
- Urinals: $25 / 20 = 1.25$, round up to 2 urinals
- Washbasins: $25 / 10 = 2.5$, round up to 3 washbasins

For 10 females:

- Toilets: $10 / 10 = 1$ toilet
- Washbasins: $10 / 10 = 1$ washbasin

Considering these calculations, you would need 2 modular building ablutions with the following configurations:

Ablution 1 (Males):

- 2 toilets
- 2 urinals
- 2 washbasins

Ablution 2 (Females and additional males):

- 2 toilets (1 for females, 1 for additional males)
- 1 washbasin (for females)
- 1 washbasin (for additional males)
- Alternatively, you could have 1 ablution for females with 1 toilet and 1 washbasin, and another ablution for males with 3 toilets, 2 urinals, and 3 washbasins.

Keep in mind that these are minimum requirements and may vary depending on local regulations, specific needs, and the duration of use. It's always a good idea to consult with local authorities or experts to ensure compliance with relevant standards and regulations.
